Claris FileMaker Pro 26.0.3 Release Notes

September 2026

This software updates FileMaker Pro to version 26 (26.0.3) and addresses issues. If you are unable to successfully update to FileMaker Pro 26, search the Knowledge Base for installation information.

New features and enhancements

PDF script step support in FileMaker WebDirect

In FileMaker WebDirect, the Open PDF and Append PDF script steps can now let web users upload a PDF file to open or append. When your script finishes PDF file operations, the Close PDF script step can let web users download the closed PDF file. Previously, only a container field or variable could be specified for the PDF file.

Known issue: In the Script Workspace, the newly supported file options for these PDF script steps incorrectly show as unsupported in FileMaker WebDirect.

Addressed issues

PDF script steps

- Copying and pasting the Print PDF script step in the Script Workspace could reset its page setup options to the default values. This included options such as paper size and orientation."
- The Print PDF script step displayed an error stating that container fields couldn't be exported. This occurred when printing to a printer whose name was 32 characters or longer.
- Using the Save Records as PDF script step to save to the currently open PDF file could produce a much larger file than expected.

Script Workspace

- Copying a Configure AI Account script step from FileMaker Pro 2025 and pasting into FileMaker Pro 2026 lost some of its options.
- Windows: The Show Custom Dialog script step's Size and Position fields didn't accept full-width numeral input from Japanese input methods.

General

- FileMaker Pro could quit unexpectedly when using **File** > **Export Records** in a file that used custom field display names.
- In the Manage Security dialog, FileMaker Pro incorrectly displayed a security risk warning about accounts with Full Access privileges not having passwords. This occurred even when those accounts had passwords set.
- Windows: Typing in a field could stop working or be delayed when an OnObjectModify trigger ran the Perform JavaScript in Web Viewer script step. Each keystroke unexpectedly moved focus to the web viewer.
- Windows: The FileMaker Pro installer didn't recognize an upgrade license certificate from an earlier qualifying version. This happened if the certificate was in a folder with a name containing Chinese, Japanese, or Korean characters.
- macOS: If you switched between windows using Spaces, running a script from the Script Workspace could run the script in the wrong window.

Platform	Product	Updates Version	Download	Languages
Windows	FileMaker Pro 26	26.0.3	Win	English Czech Polish Turkish Russian
macOS	FileMaker Pro 26	26.0.3	Mac	

APIs, technologies, or features to be deprecated

As FileMaker Pro evolves, the list of supported technologies, APIs, and features will change. As part of this evolution, certain operating systems versions, hardware, and features may be deprecated in favor of newer ones. Although deprecation does not mean the immediate deletion of an item, you should migrate your solution away from deprecated technologies, because these technologies may be removed in a future version of the product.

For the latest information about deprecated APIs, technologies, and features, search the Knowledge Base.
