

Claris FileMaker Server 26.0.3 Release Notes

September 2026

This software updates FileMaker Server 26 (26.0.3), adds new features and enhancements, and addresses issues.

FileMaker Server 26.0.3 is available as a full installer, which can also upgrade or update an existing installation.

Download the installer from your Electronic Software Download (ESD) page. Or contact our Sales team at: sales@winsoft-international.com

New features and enhancements

General

- You can now use Assisted Install.txt to specify the Accessible Keyboard Navigation setting for FileMaker WebDirect in Admin Console. You can also hide the Accessible Keyboard Navigation option in Admin Console, preventing server administrators from overriding the tab order intended by the custom app developer. See [Customize the personalization file](#) in FileMaker Server Network Install Setup Guide.
- Linux: FileMaker Server no longer requires running NginxUpdate.sh during installation, allowing automated operating system security updates to Nginx to proceed without interference.

Updated libraries and packages

The following third-party libraries have been updated to the indicated versions:

- ImageMagick 7.1.2-1

Addressed issues

Security

- Linux: The ImageMagick library used by FileMaker Server, when generating thumbnails for container fields, could read beyond allocated memory, potentially disclosing adjacent heap memory (CVE-2025-55004).

Standby Server

- After a switchover, clicking the Reopen Databases button in the banner didn't reopen the files that had been hosted on the original primary server.
- If progressive backup was enabled on a primary server before uploading a file to the server and configuring the server to use a standby server, that file wasn't transferred to the standby server.
- Removing a closed database from the primary server didn't remove it from the standby server even after a switchover.

General

- Linux: Thumbnails for PNG and PDF files in container fields displayed at low resolution and appeared blurry when files were hosted.

- FileMaker Server didn't resume remote backup tasks after a restart if it had several remote backup tasks to process.
- FileMaker WebDirect failed to load a file and quit unexpectedly if the file included a field with the Self function in its "Customize field display names" calculation.
- Linux: Adding or updating a record in a table connected to a MySQL data source using ODBC caused the Database Server to quit unexpectedly.
- Windows: A background PowerShell script ran frequently and used a large percentage of CPU even when FileMaker Server was idle.
- Upgrading from FileMaker Server 26.0.1 or earlier altered a previously configured OAuth Client Secret, causing OAuth authentication to fail.
- Uploading the latest Temurin OpenJDK 21 release to configure the Web Publishing Engine displayed an error stating that the files weren't official OpenJDK binaries.

APIs, technologies, or features to be deprecated

As FileMaker Server evolves, the list of supported technologies, APIs, and features will change. As part of this evolution, certain operating systems versions, hardware, and features may be deprecated in favor of newer ones. Although deprecation does not mean the immediate deletion of an item, you should migrate your solution away from deprecated technologies, because these technologies may be removed in a future version of the product.

For the latest information about deprecated APIs, technologies, and features, search the [Knowledge Base](#).
